Arestin Post-Treatment Information

Arestin will continue to fight infection after you have left our office. To promote effectiveness, please follow self-care and maintenance tips listed below to help protect the treated sites.

- Postpone brushing for a 12-hour period.
- For 1 week after treatment, do not touch the sites treated with Arestin and avoid eating hard, crunchy or sticky foods (such as carrots, taffy, or gum).
- Postpone the use of interproximal cleaning devices such as floss, toothpicks, or other tools designed to clean between the treated teeth for 10 days.
- Some mild to moderate sensitivity is expected during the first week after scaling, root planing and administration of Arestin.
- Scheduling and keeping follow-up visits can help maintain control of periodontal disease.
- Please notify us promptly if pain, swelling, or other problems occur.

Superior care, one patient at a time.
